

The following three questions should enable validating the combined effects of vision and childhood stress

1. Ask an individual to take the following personality preference test:

These eight items are qualities which most people believe children should have. Every person also thinks that some qualities are more important than others.

Below are four pairs of desirable qualities. For each pair, ask the individual WHICH of the two qualities in each category (either A or B) they think is more important for a child to have?

| | | | |
|--|--|---|---|
| Preference Question 1: | Preference Question 2: | Preference Question 3: | Preference Question 4: |
| ____ (A) Respect for elders OR ____ (B) Independence | ____ (A) Self-reliance OR ____ (B) Obedience | ____ (A) Good manners OR ____ (B) Curiosity | ____ (A) Being considerate OR ____ (B) Being well-behaved |

If the individual selects the **FIRST** of each pair (A) of the **FOUR** options, it indicates that the individual prefers **authoritarianism**. If the individual selects the **SECOND of each pair (B)** of the **FOUR** options, it indicates that the individual prefers **cooperation**.

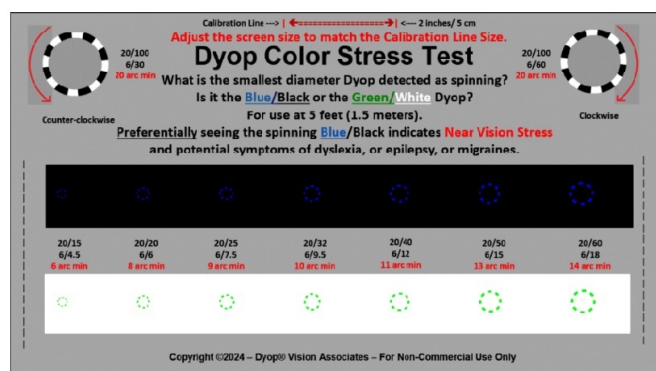

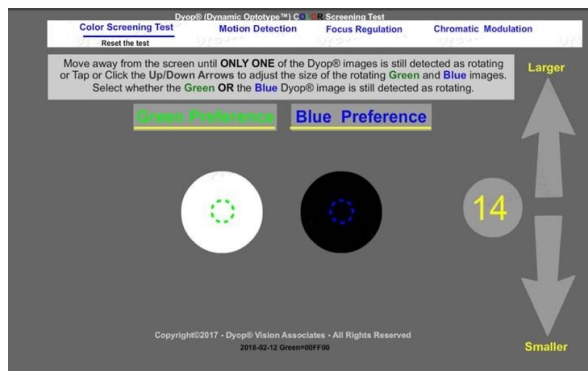

The sample questions (above) are from Matthew MacWilliams, author of ON FASCISM, in developing the "American Authoritarian Index" as presented in his book.

2. Use the 10 second Dyop color screening test (which should work on any electronic display) to determine potential symptoms of dyslexia:

PC/iPad/iPhone version of the Dyop Color Screening test:

<https://www.dyop.net/documents/Color iPad/index.html> OR <https://www.dyop.net/documents/BlueGreenScreening.gif>

Individuals preferentially seeing the **Blue/Black** ring spinning indicates likely dyslexia and a higher ratio of Red photoreceptors (**75% Red, 20% Green, and 5% Blue**) and **Near Vision Stress**. Non-dyslexics tend to see the **Green/White** spinning ring and have a more balanced Red photoreceptor ratio (**50% Red, 45% Green, and 5% Blue**).

<https://pubmed.ncbi.nlm.nih.gov/17435537/>

3. Ask those individuals if they are voting for Trump or Harris?

Symptoms of **dyslexia**, migraines, and/or epilepsy are indicated when you can **ONLY** detect the smaller **Blue/Black Dyop** as spinning and **NOT** the identical diameter spinning **Green/White Dyop**. This Dyop color screening test has a **90% correlation** to personal or family history symptoms of **Near Vision Stress** such as dyslexia or migraines.

<https://www.dyop.net/documents/Dyslexia and Color Perception-SandraStark.pdf>

Our theory is that approximately 85% of the Trump supporters (see Pre-Election Survey below) have **BOTH** a **stressed or authoritarian** childhood (as indicated by their selecting the **A Option** of ALL four of the questions in variable #1) **AND "Near Vision Stress"** (indicated by their preferentially seeing the spinning **"Blue"** ring in variable #2).

**You will want to run your own evaluation of the test for yourself and with your friends.
This is CAUSATION, NOT COINCIDENCE.**
